

SMART DUSTBIN USING ARDUINO

Abstract :

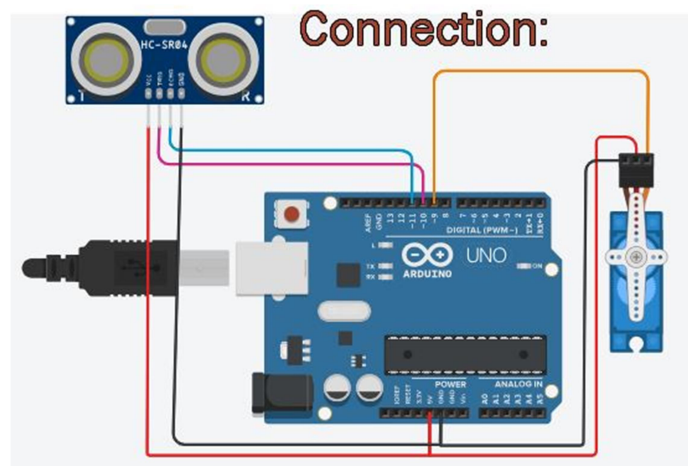

The Main Objective of the project is to design a smart dustbin which will help in keeping environment clean and also eco friendly. Nowadays Technologies are getting smarter day-by-day so as to clean the environment we are designing a smart dustbin by using Arduino . The smart dustbin management system is built on microcontroller based system having ultrasonic sensors on the dustbin. In this technology , we have designed a smart dustbin using arduino uno, along with ultrasonic sensor, servo motor and jumper wire.

After all Connection, Smart Dustbin program will run. Dustbin lid will open when some one comes near to range then wait for user to put garbage then it wait for some time and it automatically close it.

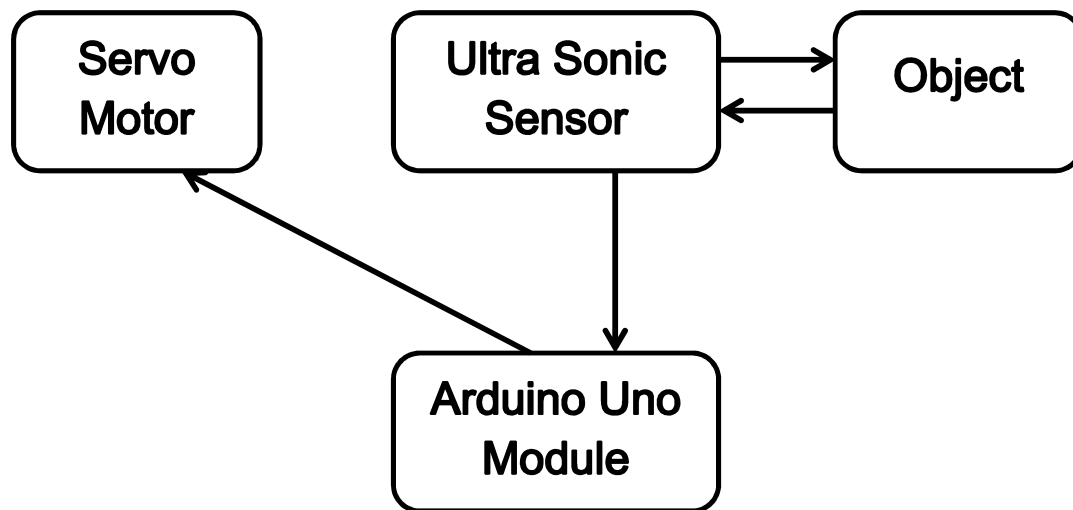

Requirements :

1. Arduino Uno
2. Ultrasonic Sensor
3. Servo Motor
4. Battery
5. Dustbin
6. Jumper Wires

Circuit Connection :
